

## THE STANDARD CAKEBOXX

### *Key Operational Advantages*

A CakeBoxx container has two separable components: the bottom deck and the lid. The lid is raised and lowered by any standard container handling equipment, and when closed, will integrate into all existing inter-modal processes (stacking, storage, terminal transfers, ship and rail).

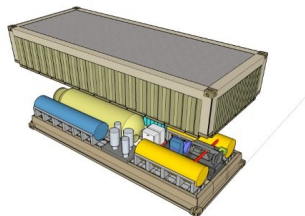

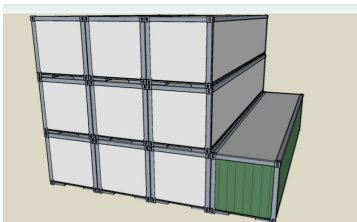

**Highest security against theft:** CakeBoxx, the innovative “No Doors” intermodal cargo container technology that raises the bar for cargo security. Once a CakeBoxx container is sealed, nothing gets in or out.

**Logistics efficiency:** Improving your logistics flow minimizes turnaround time and overhead involved with your products. Lowering costs and delivering a strong competitive advantage.

- Like a flatbed trailer, you can load and unload from all sides. Faster and with more ease.
- Maximize the loading capacity, no lost space due to poorly fitted items.
- Pick and pack operations can benefit from loading directly to open decks.
- Minimizes wasted time and space when loading irregularly sized cargo.

**Easy to open and inspect:** Once the lid is lifted, contents are completely exposed for inspection by customs and authorized personnel. Nothing is more than four feet away from an inspector who can verify manifests, scan, sniff, and visually assess the entire cargo without needing to move it.

**Maximize loaded container space:** Standard containers typically lose a foot off space with each full load, due to palletization. Movement of these “dead spaces” adds additional cost. The CakeBoxx unlocks the opportunity to generate more revenue and lower costs.

**Nationwide support network:** Through our partnership with DELBROS Leasing, you can benefit from nationwide support in financing, rescue, maintenance, and positioning.
